
PROJECT PROPOSAL — MILESTONES 2 & 3

Coin Appraisal Register

Feature-by-feature build & hand-off plan, with revised pricing.

Prepared	May 2026
For	Coin Appraisal Register — M2 & M3 expansion
By	Flowtive (kristof@getflowtive.com)
Reference	App Build Scope, Updated May 2026

How to read this proposal

The May 2026 scope document is substantial. Rather than quote one number for the whole thing, I have gone through it feature by feature and split it into three buckets:

- BUILD** — Inside our wheelhouse. We will build it as part of this engagement.
- BUILD W/ FALLBACK** — We will build the feature using the spec's documented fallback path. The "premium" version (typically a paid SDK or specialist integration) is not included.
- HAND OFF** — Outside our wheelhouse, or compliance/liability work that should sit with a specialist. We are not building these. Recommended to subcontract or defer.

This approach lets you keep the price down, stay on schedule, and avoid paying our rate on work better suited to a specialist.

Pricing summary

Milestone	Quote
M1 — Three fixes (already contracted)	\$175 no change
M2 — Full scope (build items only — see breakdown)	\$5,800
M3 — PWA (already contracted)	\$350 no change
M3 — Protection layer (build items only — see breakdown)	\$3,000
Total project value	\$9,325
Of which new commitment for M2 + M3 protection layer	\$8,800

Headline: \$8,800 covers the bulk of the M2 and M3 scope — every coin type, the full deal flow, all four API integrations, the GHL bidirectional sync, the compliance flags, the Deal_Log build, and the entire M3 protection layer (PIN auth, manager workflows, picker enhancements). The five items in the hand-off list are the parts where a specialist will deliver a better outcome at a lower combined cost than us building them ourselves.

M2 scope — feature-by-feature breakdown

Every feature listed in the M2 section of the App Build Scope, with our build / hand-off decision and short rationale.

New coin types & pricing methods

Feature	Status	Notes
Bullion coins (8 types) — unit × spot + configurable premium	BUILD	Direct extension of existing bulk-calc formulas. Premiums driven from Config_CoinTypes.
Sterling silver flatware — gram × purity × spot, with hallmark popup	BUILD	Mandatory popup blocking weight entry until dismissed.
Foreign silver coins (4 entries, including manual purity override)	BUILD	Stored purity factors + the override selector for the fourth entry.
Paper money — manual entry with denomination, year, condition, offer, manager-review note	BUILD	Standard form. Static note always visible when this item type is open.
Numismatic grading selector (Circulated / Uncirculated / Slabbed)	BUILD	Per-condition multipliers from Config_CoinTypes.
Pre-1933 US Gold full-screen red hard stop with timestamped acknowledgment	BUILD	Cannot be skipped or dismissed via back button. Flag written to deal record.

Lookup integrations

Feature	Status	Notes
Graded coin lookup — PCGS CoinFacts cert authentication	BUILD	Make.com HTTP integration. Requires PCGS API key live before M2 starts.
Graded coin lookup — CDN Greysheet Dealer+ wholesale pricing	BUILD	Make.com HTTP integration. Requires CDN paid subscription with API tier enabled.
Fallback chain: CDN → Manual_Price_Override → ask manager	BUILD	Side-by-side display of CDN price + offer at margin.
Barcode scanner — Code 128 + QR (with manual cert fallback)	BUILD	Browser-based scanner via ZXing-js. Manual cert entry always available.
eBay sold-listings comps via Apify actor (low / median / high)	BUILD	Range logged to deal record on every lookup. Empty results treated as valid (rep falls back to judgment).

Full deal flow

Feature	Status	Notes
Customer intake screen — name, phone, DOB, zip, TCPA opt-in	BUILD	All fields required before calculator opens. Standalone zip field, independently queryable.
Driver's license capture	BUILD W/ FALLBACK	We build photo capture (uploaded to Airtable) + manual DL number entry. Automated PDF417 OCR via paid SDK is in the hand-off list below.
Under-18 hard stop (DOB-driven)	BUILD	Deal cannot proceed.
Mandatory collection photo at intake	BUILD	Uploaded to Airtable as attachment, URL stored in Collection_Photo_URL.
Item entry screen with dual real-time totals (melt + offer)	BUILD	Already partially live from M1. Lookup integrations available from this screen.
Deal summary screen — line items, totals, margin %, Accept/Decline	BUILD	Full breakdown before commit.
Customer-facing flip view (hides margin %)	BUILD	One-tap toggle from summary screen.
Acceptance flow — payment selector, \$9,500 cash hard stop, offer letter PDF, signature, item photos, review prompt, SMS	BUILD	SMS goes via the GHL webhook to opted-in customers. Offer letter PDF generated client-side.
Decline flow — 24-hour price lock + declined webhook	BUILD	Captures phone if not on file, creates Airtable record with price-lock flag.

GHL integration

Feature	Status	Notes
Accepted-deal webhook — full payload per spec	BUILD	customer info, deal value, item tags, deal ID.
Declined-deal webhook — contact info + tag set	BUILD	Includes deal_declined and (where applicable) price_lock_24hr tags.
Bidirectional ID capture — write GHL Contact ID + Opportunity ID back to Airtable	BUILD	Make.com captures the GHL response and writes both IDs to the matching deal record.
Inside-GHL automation (workflows, SMS templates, pipelines)	HAND OFF	Already excluded by the scope wording. Operator handles GHL-side configuration.

Compliance automation

Feature	Status	Notes
Texas 48-hour LE report — nightly Make scenario, formatted PDF email	BUILD W/ FALLBACK	We build PDF email per the scope wording. If the recipient (PD or DPS) requires a custom format / state portal upload, that is in the hand-off list below.
Structuring detection — same name or DL across cash transactions, 24h rolling window	BUILD	Manager alert with prior history before either deal can close. Both deals flagged.
Form 8300 flag — auto-set when single cash transaction exceeds \$10,000 after override	BUILD	Flag-only, per spec.
1099-B threshold tracking — per-customer rolling 12-month volume + SSN/EIN capture prompt	BUILD W/ FALLBACK	We build the threshold trigger, capture flow, and flag fields. Actual IRS filing automation and audit-grade SSN/EIN encryption are in the hand-off list below.

Data model & documentation

Feature	Status	Notes
Deal_Log table with all 35+ fields, exact column names	BUILD	Built before any Make scenario is wired.
Auto-populated Operator_ID + Location_ID on every deal	BUILD	Driven from single-row config tables; no developer involvement needed to change.
Spot price snapshot on deal completion (gold + silver)	BUILD	Captured at the exact moment of completion.
Loom walkthrough — every admin-editable Make setting + every config table	BUILD	Recorded so a non-technical admin can update margins, coin types, locations, recipients without breaking the build.

M3 protection layer — feature-by-feature breakdown

The \$350 PWA frontend is already contracted. The breakdown below covers only the new protection and usability layer added on top of it.

Authentication & permissions

Feature	Status	Notes
Rep PIN authentication (4-digit, encrypted, 3-strike lockout, manager alert)	BUILD	PIN encrypted in Reps_Master. Lockout for 5 minutes on three failed attempts.
Manager permission tier — yellow flag override, high-value approval, full activity log access	BUILD	Separate manager PIN. Manager-only views in the PWA.
App auto-lock after 2 minutes inactivity, requires Face ID or PIN	BUILD	Inactivity timer + reauth screen.

Flag system & manager workflows

Feature	Status	Notes
Three-color flag system (Green / Yellow / Red) with all five red triggers from spec	BUILD	High-value, Pre-1933, \$9,500 cash, weight mismatch > 10%, structuring pattern.
High-value approval gate — Pending Approval screen until manager acts remotely	BUILD W/ FALLBACK	We use Airtable polling (5s interval) for manager response. Native iOS push is in the hand-off list below.
Ask Manager button — freezes deal, notifies, writes timestamped note	BUILD	Permanent button on every screen.
Not Sure What This Is button — photo to manager, search reference guide, save to pending	BUILD	Reference guide content sourced from Config_CoinTypes + key date warnings.
Suspicious Item workflow — flag pauses deal, manager PIN required to resume	BUILD	Reason + rep name + timestamp written to audit trail.

Usability & estimation

Feature	Status	Notes
Estate Lot Bulk Estimate Mode — sample-and-extrapolate with disclaimer	BUILD	Visible "this is an estimate" disclaimer.
Picker — coin image + expected gram weight next to each coin	BUILD	Pulled from Config_CoinTypes.
Picker — search and filter bar at the top	BUILD	Quick filtering by name / category.
Picker — recently used (last 6) quick-tap row	BUILD	Stored locally per device.
Picker — key date warnings embedded inline	BUILD	Pulled from key_date_warning.

Feature	Status	Notes
Spot price 24-hour change indicator on main screen (gold + silver)	BUILD	Shows movement since prior day's close.
Plain English tooltips on Face Value, Melt Value, Times Face	BUILD	Tap-to-reveal one-sentence explanation.

PWA infrastructure (already contracted at \$350)

Feature	Status	Notes
React PWA on Vercel under client GitHub, iPad Safari install flow, 3 months bug-fix support	INCLUDED	Already delivered and live at https://coin-appraisal-register.vercel.app . No change.

What we recommend handing off

The five items below are inside the scope document but outside our wheelhouse — either because they require a paid third-party SDK, specialist compliance/security work, or a platform we do not support. For each one, we either build a clean fallback path (so the app still works) or recommend you bring in a specialist.

HAND OFF 1 — SPECIALIST (MOBILE / SDK)

Driver's license PDF417 OCR via paid SDK

Reliable PDF417 barcode parsing on iOS Safari requires a commercial SDK such as Microblink BlinkID, Scandit, or Mitek. Those run \$200–2,000/month in license fees and need a developer with their specific SDK experience. Our default build covers photo capture (uploaded to Airtable as the audit record) plus manual DL number entry — which complies with the scope's "or manual entry of DL number" wording. If you want true automated capture later, a mobile / SDK specialist is the right person to wire it in.

HAND OFF 2 — SPECIALIST (SECURITY / COMPLIANCE)

Audit-grade SSN / EIN encrypted vault

The scope requires SSN/EIN to be stored encrypted. Airtable provides platform-level encryption-at-rest, which we will use as the default. If your tax counsel requires field-level customer-managed encryption (typical for IRS-reportable PII), the right home for that field is a separate vault — HashiCorp Vault, AWS Secrets Manager, or a managed service like Stripe Identity. That setup is a separate security engagement (~\$1,500–3,000) and should be done by someone whose day job is compliance/security work.

HAND OFF 3 — TAX / COMPLIANCE SPECIALIST

Actual IRS 1099-B filing automation

The rules for which precious-metals transactions are 1099-B reportable are non-obvious — the threshold is not just "\$10,000 cumulative"; it depends on specific items and quantities (e.g. 1,000+oz silver bars, 25+ pieces of pre-1965 90% silver coin, etc.). Our build covers the threshold trigger, the SSN/EIN capture flow, and the flag fields on the deal record. Anything beyond that — the actual filing logic, IRS form generation, classification of which transactions trigger reporting — is tax compliance work and should be handled by a tax-tech specialist or your tax counsel.

HAND OFF 4 — SPECIALIST (STATE PORTAL INTEGRATION, IF REQUIRED)

Custom Texas LE report formats beyond formatted PDF email

The scope wording says "emails a formatted transaction report" — that is what we build. If the receiving department (local PD or Texas DPS) actually requires a different format (CSV, structured XML, upload to a state portal, proprietary format), each of those is a meaningfully different build and the recipient typically dictates exact requirements. That is integration specialist territory, not Make.com generalist territory. Confirm the recipient's actual requirement before this becomes an issue.

HAND OFF 5 — NATIVE MOBILE (ONLY IF REQUIRED)

Native iOS push notifications for the manager approval gate

iOS Safari Web Push works for installed PWAs (iOS 16.4+) but Apple throttles delivery aggressively — it is not suitable for sub-second manager approval. Our default architecture is short-interval Airtable polling (5s) on the rep's Pending Approval screen, which is reliable on iOS Safari and meets the scope's functional requirement. If you decide later that you need true native push, you are moving from a PWA to a native iOS app — that is a different platform and should be quoted as a separate native build.

Decisions needed before M2 starts

DECISION 1

API credentials confirmed live in Make.com

Per the scope document, M2 does not start until PCGS CoinFacts, CDN Greysheet Dealer+, GoldAPI, and Apify (paid plan, 50 runs/day minimum) are all confirmed returning data in Make.com under the operator's credentials.

DECISION 2

Driver's license capture path

Confirm photo + manual DL number entry is acceptable (default, no extra cost), or budget for a paid SDK and a mobile/SDK specialist to integrate it.

DECISION 3

SSN / EIN storage path

Confirm Airtable platform encryption-at-rest is acceptable for SSN_EIN_Captured (default, no extra cost), or scope a separate vault engagement.

DECISION 4

Texas 48-hour report format

Confirm formatted PDF email is acceptable, or specify the recipient's required format / system.

Honest timeline

The scope document targets a fully deployed app within 90 days. With this build/hand-off split:

Phase	Realistic duration	Notes
M2 — build items	50–75 days	From confirmed API access. Compliance flags + deal flow are the largest blocks.
M3 — protection layer build items	25–40 days	Largely additive on top of M2. Some overlap with M2 testing is possible.
Combined M2 + M3 (build only)	75–110 days	90 days is achievable with zero blockers on APIs and the four decisions resolved week 1.

Payment structure

Recommended payment milestones for both new quotes:

- **M2 (\$5,800):** 40% on kickoff once APIs and decisions are confirmed (\$2,320), 30% at the deal flow + compliance engine demo (\$1,740), 30% on iPad acceptance test pass (\$1,740).
- **M3 protection layer (\$3,000):** 50% on kickoff after M2 sign-off (\$1,500), 50% on iPad acceptance test pass (\$1,500).

What is *not* in this proposal

- **The five hand-off items above** — DL OCR SDK, encrypted vault, IRS 1099-B filing automation, custom LE report formats, native iOS push.
- **Inside-GHL automation** — workflows, SMS templates, follow-up sequences, opportunity pipeline configuration. Outbound webhook only on our side.
- **Recurring third-party API and infrastructure costs** — PCGS, CDN Greysheet, GoldAPI, Apify, Make.com Pro tier, Vercel, Airtable, optional DL OCR SDK, optional SSN vault. These are operator costs, not dev costs.
- **Hardware** — iPads, mounts, external barcode scanners.
- **Branding assets** — logo, accent color, app name. Build proceeds with placeholders; final assets land via follow-up update.
- **Post-launch new features** — the M3 PWA contract includes 3 months of bug-fix support. New features after launch are separate scope.
