

App Build Scope

Updated | May 2026

AIRTABLE BASE STRUCTURE

Build all tables below before starting any milestone. Every table must exist with the correct columns before the Make.com scenarios or the app can reference them. Column names must match exactly as written throughout this document. Specific values for multipliers, premiums, margins, and operator details will be populated by me directly in Airtable. You do not need those values to build the system.

Config_CoinTypes

One row per coin or metal type. Admin edits this table to add or change coin types without touching Make.com.

- * coin_name (text): display name shown in the picker
- * category (single select): values include silver_coin, gold_coin, bullion, numismatic, flatware, foreign_silver, paper_money, collectible, jewelry
- * pricing_method (single select): values include spot_silver, spot_gold, times_face, unit_spot_premium, gram_purity, manual
- * silver_content_oz (number): troy oz of silver per unit, if applicable
- * gold_content_oz (number): troy oz of gold per unit, if applicable
- * purity_factor (number): decimal purity, populated where applicable
- * face_value (number): face value in dollars, for numismatic times-face coins
- * fixed_multiplier (number): multiplier applied to face value for numismatic pricing. Values populated by me in Airtable.
- * premium_configurable (checkbox): if checked, the Airtable premium field is applied on top of spot for bullion coins
- * premium_amount (number): dollar premium added to spot per unit. Values populated by me in Airtable.
- * gram_weight_expected (number): expected weight in grams, shown in the picker for reference
- * coin_image_url (url): image shown in the picker next to the coin name
- * key_date_warning (long text): if populated, a warning alert appears when this coin is selected listing key dates and approximate values
- * active (checkbox): unchecked rows do not appear in the picker

Config_Margins

One row per category. Admin edits margin percentages here. Make.com reads this table fresh on every calculation. No scenario changes needed to update margins. All margin values are populated by me in Airtable.

- * category (single select): matches the category values in Config_CoinTypes
- * margin_percent (number): the percentage withheld from melt value to produce the offer
- * updated_at (date): auto-populated by Airtable
- * updated_by (text): who changed it last

Config_Operator

Single row. Identifies the business running the app. Populates Operator_ID on every deal record automatically. All values populated by me.

- * operator_id (text): short code
- * operator_name (text): full business name
- * operator_address (text): physical address, used in compliance reports
- * operator_email (text): email address for compliance report delivery
- * dealer_license_number (text): state dealer license number, used in compliance reports

Config_Location

One row per physical location. Each iPad installation references one Location_ID. Populates Location_ID on every deal record automatically. All values populated by me.

- * location_id (text): short code
- * location_name (text): display name
- * location_address (text)
- * location_city (text)
- * location_zip (text)

Reps_Master

One row per rep. Drives the rep dropdown in the app and the PIN authentication in Milestone 3.

- * rep_id (auto number)
- * rep_name (text)
- * rep_pin (text, encrypted): 4-digit PIN, used in Milestone 3
- * role (single select): values rep, manager
- * active (checkbox)

Manual_Price_Override

Fallback pricing for ungraded or raw coins not covered by CDN Greysheet. Admin maintains this table. The graded coin lookup checks CDN first, falls back to this table if nothing is returned. Values populated by me.

- * item_description (text)
- * manual_max_buy (number): maximum offer in dollars
- * source (text): where the price came from
- * updated_at (date)

Deal_Log

Full specification is in the Milestone 2 section. Build the table with all columns listed there before Make.com scenarios are wired.

API Credentials

Confirm all of the following are loaded in Make.com under my credentials before starting M2. Do not start M2 until each is confirmed live and returning data.

- * GoldAPI.io: live gold and silver spot prices
 - * PCGS CoinFacts API: cert authentication for graded coin lookup
 - * CDN Greysheet Dealer+ API: wholesale pricing for graded coins
 - * Apify (paid plan, minimum 50 actor runs per day): eBay Sold Listings actor for collectible comps
-

MILESTONE 1: FIXES BEFORE I RELEASE \$175

These three items were in my original specification but missing from the delivery. No extra charge needed.

Fix 1: Numismatic Coins (Times-Face Pricing)

Add face_value and fixed_multiplier columns to Config_CoinTypes if not already present. The eleven coins below price by qty x face value x fixed_multiplier only. No spot price involved. Specific face value and multiplier values will be populated directly in the Airtable Config_CoinTypes table by me. You do not need those values to build the calculator. The calculator simply reads whatever is in those columns and multiplies.

- * Wheat/Steel Penny
- * Indian Head Penny
- * Flying Eagle Penny
- * Large Cent
- * Shield Nickel
- * Victory Nickel
- * Buffalo Nickel
- * Half Cent
- * 2 Cent Piece
- * 3 Cent Piece
- * Costume Jewelry

Fix 2: Numeric Keypad

Numeric keypad on every quantity and weight field. The iOS standard keyboard must never appear on iPad for these inputs. Large tap targets only.

Fix 3: Dual Totals

Dual totals visible at the top of the screen at all times while items are in the bag: 100 percent melt value (what the metal is worth) and the offer at margin (what we pay). Both numbers update in real time as items are added.

Once those three items are tested on an iPad I will release the \$175 and fund M2 the same day.

MILESTONE 2: FULL SCOPE (need your price)

This combines the original M2 contract deliverables with the expanded scope below into one milestone.

New Coin Types

Bullion Coins

Priced at unit x spot price plus a configurable premium stored in Config_CoinTypes. Not by gram weight. Premium is set per coin type in the Airtable config table by me. The calculator reads the premium field and adds it to the spot calculation.

- * American Silver Eagle (1 troy oz silver)
- * American Gold Eagle 1oz
- * American Gold Eagle 1/2oz
- * American Gold Eagle 1/4oz
- * American Gold Eagle 1/10oz
- * Canadian Maple Leaf (1 troy oz gold)
- * Krugerrand (1 troy oz gold)
- * Mexican Onza (1 troy oz silver)

Sterling Silver Flatware

Priced by weight in grams x purity factor (from Config_CoinTypes) x live silver spot price. Every time this item is selected an automatic popup must appear with the following text: STERLING, 925, or lion hallmark means real silver. EP, EPNS, or SILVERPLATE means worth \$0 for scrap. Rep must dismiss the popup before entering weight.

Foreign Silver Coins

Four entries in the picker. Purity factors stored in Config_CoinTypes and applied to the calculation. The fourth entry has a manual purity selector for cases where rep needs to override.

- * Canadian silver pre-1968
- * Mexican silver peso
- * British pre-1947
- * Foreign silver (other) with manual purity percentage selector

Paper Money

Manual entry only. Fields required: denomination, year, condition selector with options Poor, Fine, VF, and Unc, and offer amount entered by the rep. Static note displayed on screen at all times when this item type is open: Star notes, 1928 series, and low serial numbers may be worth significantly more. Flag for manager review before making any offer.

Grading Selector for Numismatic Coins

For all numismatic coin types add a condition selector: Circulated, Uncirculated, Slabbed. The multiplier adjusts based on the condition selected. Multiplier values per condition are configurable in Config_CoinTypes and populated by me in Airtable.

Pre-1933 US Gold Hard Stop

When Double Eagle (\$20), Eagle (\$10), Half Eagle (\$5), or Quarter Eagle (\$2.50) is selected the app must immediately cover the entire screen with a red hard stop screen. Text: Pre-1933 US gold coin. Numismatic value may far exceed melt value. Do not make any offer based on gold weight alone. Stop this transaction. Manager review required before proceeding. The rep must tap an acknowledgment button to continue. This screen cannot be skipped, dismissed by back button, or bypassed under any circumstances. The acknowledgment must write a timestamped flag to the deal record.

Graded Coin Lookup

Rep scans a barcode or manually enters a cert number. PCGS CoinFacts API authenticates the cert and returns coin identity and grade. CDN Greysheet API returns the wholesale pricing for that coin at that grade. The app displays both the CDN price and the calculated offer at margin side by side.

- * Barcode scanner handles both Code 128 and QR codes
- * Manual cert entry field available as fallback at all times
- * If CDN returns no result, app falls back to Manual_Price_Override table in Airtable
- * If Manual_Price_Override also has no result, rep is prompted to contact manager

eBay Comps for Collectibles

Rep types an item name or description into a search field. Make.com calls the Apify eBay Sold Listings actor and returns a price range of recent completed sales. The app displays the low, median, and high of the range. Rep picks an offer within that range. The range shown must be logged to the deal record.

Full Deal Flow

Step 1: Customer Intake Screen

This screen appears at the start of every deal before the calculator opens. All fields are required. The calculator does not open until every field is complete.

- * Customer full name
- * Customer phone number
- * Driver's license: camera capture (preferred) or manual entry of DL number
- * Date of birth
- * Customer zip code: standalone required field, not part of an address block, independently queryable in Airtable
- * TCPA opt-in checkbox: text reads I agree to receive text messages from this business. Required field. If unchecked, no SMS will be sent to this customer at any point. The opt-in status must be passed in the GHL webhook payload.

If date of birth shows customer is under 18 the deal must immediately hard stop with a message requiring guardian consent. The deal cannot proceed.

Step 2: Collection Photo

Before entering any items the rep is prompted to photograph the full collection laid out. This step is mandatory and cannot be skipped. Photo uploads to Airtable as an attachment on the deal record. The photo URL is stored in Collection_Photo_URL in the deal log.

Step 3: Item Entry

Rep selects coin types from the picker and enters quantities or weights. Dual totals (100 percent melt and offer at margin) update in real time at the top of the screen. For graded coins the cert lookup is available from within this screen. For collectibles the eBay comp lookup is available from within this screen.

Step 4: Deal Summary Screen

Before confirming, the rep sees all line items with quantities, individual calculated values, total 100 percent melt value, total offer at margin, and the margin percentage. Two action buttons: Accept and Decline.

Step 4a: Customer-Facing Screen

From the deal summary the rep can flip the iPad to a customer-facing view. This screen shows the math in plain language: what each item contains, what the metal is worth at 100 percent, and what the business is offering. The customer does not see the margin percentage. This view is accessible from the summary screen with one tap.

Step 5a: Acceptance Flow

If the customer accepts:

- * Payment method selector: Cash, Check, Wire, P2P
- * If Cash: exact amount received field required. When cash amount reaches \$9,500 the deal must hard stop and require manager PIN acknowledgment before continuing. This cannot be bypassed.
- * If Check: check number field required
- * Auto-generated offer letter displayed and available to print or share as PDF: all line items, total, spot price at time of deal, rep name, date, customer name
- * Customer signature capture on screen. Cannot skip.
- * After signature: rep must photograph all purchased items before the deal can be marked complete. Cannot skip. All item photos upload to Airtable as attachments. Comma-separated URLs stored in Item_Photos_URLs in the deal log.
- * Deal complete screen: Google review prompt with QR code or direct link. Shareable PDF link for the deal summary. If customer opted in to TCPA, SMS sends the PDF link to their phone number automatically.

Step 5b: Decline Flow

If the customer declines:

- * A button appears: Lock in today's price for 24 hours. Tapping it captures the customer phone number if not already on file and creates a deal_declined record in Airtable with a 24-hour price lock flag.
- * Make.com fires the declined webhook to GHL with the contact info, deal_declined tag, and price_lock_24hr tag so the follow-up automation can fire.

GHL Webhook Connection (Make.com side only)

Build only the outbound webhook modules inside Make.com. Everything inside GHL after the webhook fires is handled separately and is not in scope.

Accepted Deal Webhook

When a deal closes as accepted, Make.com fires a webhook to a GHL endpoint. Payload must include:

- * customer_name
- * customer_phone
- * customer_dl

- * customer_zip_code
- * tcpa_opt_in (boolean)
- * deal_value (total offer amount)
- * item_tags: silver_seller, gold_seller, or coin_collector based on categories purchased. Multiple tags if multiple categories.
- * deal_id (the Airtable Deal_ID)

After the webhook fires, Make.com must capture GHL's response, parse the GHL Contact ID and GHL Opportunity ID from the return payload, and write both values back to the matching Airtable deal record before the scenario closes. The deal log fields GHL_Contact_ID and GHL_Opportunity_ID must be populated on every accepted deal.

Declined Deal Webhook

When a deal closes as declined, Make.com fires a separate webhook to a GHL endpoint with:

- * customer_name
- * customer_phone
- * customer_zip_code
- * tcpa_opt_in (boolean)
- * tags: deal_declined, and price_lock_24hr if the customer tapped the lock-in button
- * deal_id

Compliance Automation

Texas 48-Hour Law Enforcement Report

A Make.com scenario runs at 11 PM every night and emails a formatted transaction report to the recipient address configured in Config_Operator. The report must include for each transaction completed that day: dealer name and address, dealer license number, transaction date and time, customer full name, customer driver's license number, customer date of birth, customer address (street, city, state, zip), each item description with quantity, price paid for each item, total amount paid, and payment method.

Structuring Detection

If the same customer name or same driver's license number appears in two or more cash transactions within any 24-hour window where the combined cash total approaches \$10,000, the manager receives an alert before either deal can close. The alert must display the customer's transaction history for the prior 24 hours and require manager acknowledgment. Both deals are flagged with Structuring_Flag set to true in the deal log.

Form 8300 Flag

When a single cash transaction exceeds \$10,000 after manager override of the \$9,500 hard stop, the `Form_8300_Flag` field in the deal log is automatically set to true. No separate workflow is required in this milestone. The flag is the output.

1099-B Threshold Tracking

Track reportable quantities per customer across a rolling 12-month window by matching customer DL number. When a customer's cumulative transaction volume hits a reportable threshold, the app prompts the rep for the customer's SSN or EIN before the deal can complete. The SSN or EIN captured must be stored encrypted in the deal log field `SSN_EIN_Captured`. The boolean fields `1099B_Flag` and `1099B_Collected` must both be written to the deal log.

Full Deal Log to Airtable

Every completed deal, accepted or declined, writes all of the following fields. Build the `Deal_Log` table with every column listed below before wiring any Make.com scenarios. Column names must match exactly.

- * **Deal_ID:** auto-generated unique identifier
- * **Operator_ID:** text, pulled from `Config_Operator`, auto-populated on every record
- * **Location_ID:** text, pulled from `Config_Location`, auto-populated on every record
- * **Rep_Name:** text, linked from `Reps_Master`
- * **Customer_Name:** text
- * **Customer_DL:** text
- * **Customer_DOB:** date
- * **Customer_Phone:** text
- * **Customer_Zip_Code:** text, required, standalone field
- * **TCPA_Opt_In:** boolean
- * **Deal_Date_Time:** datetime
- * **Spot_Price_Gold:** number, gold spot price at the exact moment the deal was completed
- * **Spot_Price_Silver:** number, silver spot price at the exact moment the deal was completed
- * **CDN_Comp_Price_Shown:** number, the CDN Greysheet price returned during the graded coin lookup, null if no lookup was performed
- * **eBay_Comp_Low:** number, low end of eBay sold range returned, null if no collectible lookup
- * **eBay_Comp_High:** number, high end of eBay sold range returned, null if no collectible lookup
- * **Items_JSON:** long text, all line items with coin type, quantity or weight, category, calculated melt value, and offer amount per line
- * **Total_Melt_Value:** number
- * **Total_Offer_Amount:** number
- * **Margin_Percentage:** number
- * **Offer_Accepted:** boolean

- * **Payment_Method:** single select: Cash, Check, Wire, P2P
- * **Cash_Amount_Received:** number, populated if payment method is Cash
- * **Check_Number:** text, populated if payment method is Check
- * **Pre1933_Acknowledged:** boolean, true if a Pre-1933 gold warning was triggered and acknowledged
- * **Form_8300_Flag:** boolean
- * **Structuring_Flag:** boolean, auto-set by structuring detection logic
- * **1099B_Flag:** boolean
- * **1099B_Collected:** boolean
- * **SSN_EIN_Captured:** text, encrypted, populated only when 1099-B threshold is hit
- * **Collection_Photo_URL:** url, photo of full collection taken at intake
- * **Item_Photos_URLs:** long text, comma-separated URLs of all item photos taken after acceptance
- * **Customer_Signature_URL:** url, captured customer signature
- * **Offer_Letter_URL:** url, if generated
- * **Deal_Summary_PDF_URL:** url
- * **GHL_Contact_ID:** text, populated by Make.com from GHL webhook response
- * **GHL_Opportunity_ID:** text, populated by Make.com from GHL webhook response
- * **Deal_Status:** single select: Accepted, Declined, Price_Lock_24hr, Pending_Approval
- * **Price_Lock_Expiry:** datetime, populated if customer selected 24-hour price lock

The Config_Operator and Config_Location tables must each have a single editable row that auto-populates Operator_ID and Location_ID on every new deal record. This must require no developer involvement to change.

Loom Walkthrough

A recorded walkthrough covering every admin-editable setting in Make.com and every config table in Airtable. Any future developer or non-technical admin must be able to update margins, add coin types, change location info, or modify compliance report recipients without breaking the build.

MILESTONE 3: PROTECTION LAYER AND PWA (need your price)

The custom PWA frontend is already contracted at \$350 and is included in this milestone. The scope below adds the protection and usability layer on top of it.

Protection Layer

Rep PIN Authentication

Each rep enters a 4-digit PIN to open the app. PIN is stored encrypted in Reps_Master. Three wrong attempts locks the app for 5 minutes and sends an alert to the manager's device.

Manager Permission Tier

A separate manager PIN allows overriding yellow flags, approving high-value deals, viewing all rep activity logs, and accessing the full deal history for the location.

Three-Color Flag System

Green: proceed normally. Yellow: check with manager before continuing. Red: hard stop, manager PIN required to continue.

Red triggers automatically when:

- * A deal exceeds the configurable high-value threshold
- * Any Pre-1933 gold coin is selected (also triggers the hard stop screen from M2)
- * Cash amount approaches \$9,500
- * Entered weight does not match the expected gram weight in Config_CoinTypes by more than 10 percent
- * Same customer DL appears in two cash transactions within 24 hours (structuring detection)

High-Value Approval Gate

When a deal exceeds the configurable dollar threshold, a push notification fires to the manager's device. The rep sees a Pending Approval screen and cannot complete the deal until the manager approves or declines remotely. The deal record in Airtable is updated with Deal_Status set to Pending_Approval until the manager acts.

Ask Manager Button

A permanent Ask Manager button visible on every screen. One tap freezes the current deal state, sends the manager a notification with the current line items and totals, and creates a timestamped note on the deal record. Manager can respond from their device.

Not Sure What This Is Button

On the main item selection screen. Opens three options: take a photo and send to manager (photo uploads to Airtable and a notification fires), search the reference guide, or add item to pending deals for later review.

Suspicious Item Workflow

Rep taps a flag on any item or at any point in the deal. The deal pauses. Rep types a reason. The record is timestamped with the reason and rep name. A manager must review and enter their PIN before the deal can continue.

Estate Lot Bulk Estimate Mode

Rep enters a sample count and average value from a spot check of part of the collection, then enters the estimated total quantity. The app extrapolates a total offer for the full collection with a visible disclaimer that this is an estimate based on sampling.

App Auto-Lock

After 2 minutes of inactivity the app locks and requires Face ID or PIN to reopen.

Picker Usability Enhancements

- * Small coin image and expected gram weight shown next to each coin in the picker list, pulled from Config_CoinTypes
- * Search and filter bar at the top of the coin picker
- * Recently used section at the top of the picker showing the last 6 coin types as quick-tap buttons
- * Key date warnings embedded in the picker, pulled from the key_date_warning field in Config_CoinTypes
- * Spot price 24-hour change indicator on the main screen showing gold and silver movement since the prior day's close
- * Plain English tooltips on Face Value, Melt Value, and Times Face: tapping a small info icon shows a one-sentence explanation

Custom PWA Build (already contracted at \$350)

- * React PWA deployed on Vercel under my GitHub account. You are a collaborator, not the owner.
- * iPad Safari install flow: opens full screen with no browser chrome, installs to the home screen like a native app
- * Handles both Code 128 and QR barcodes
- * 3 months of bug fix support after launch. New features are separate scope.

SUMMARY

M1: No charge

Fix the three gaps. I release \$175 and fund M2 the same day once tested on an iPad.

M2: Need your price

One number covering the compliance engine, GHJ webhook with bidirectional ID capture, new coin types, full deal flow with all fields, and Loom walkthrough.

M3: Need your price

The \$350 PWA is already agreed. Quote the protection layer separately.

Before pricing M2, confirm in your reply that all four API keys are live and returning data in Make.com: PCGS CoinFacts, CDN Greysheet, GoldAPI, and Apify on a paid plan. I will add any missing credentials before you begin.

Target is full app deployed within 90 days. If that is not realistic with this scope give me your honest timeline.
