
PROJECT QUOTE — MILESTONES 2 & 3

Coin Appraisal Register

Pricing for the expanded scope: compliance engine, full deal flow, protection layer.

Prepared	May 2026
For	Coin Appraisal Register — M2 & M3 expansion
By	Flowtive (kristof@getflowtive.com)
Reference	App Build Scope, Updated May 2026

Summary

The May 2026 scope document expands the original M2 and M3 deliverables substantially. M1 stays at **\$175** — the three fixes (numismatic times-face pricing, numeric keypad, dual totals) are included at no extra charge as documented in the scope. The numbers below cover the new M2 and M3 scope.

Milestone	Quote
M1 — Three fixes (already contracted)	\$175 no change
M2 — Full scope (compliance, deal flow, GHL, new coin types, Loom)	\$7,500
M3 — PWA (already contracted)	\$350 no change
M3 — Protection layer (new scope)	\$3,500
Total project value	\$11,525

Why these numbers, in one sentence: the new M2 scope is roughly 25× the size of the original M2 contract — four external paid APIs, multi-step legal compliance automation, signature/photo capture, PDF generation, customer-facing screens, GHL bidirectional sync, and 35+ deal-log fields — and the M3 protection layer adds an entire authentication and approval system on top of the contracted PWA. The quotes reflect the actual build effort while staying well below standard agency rates for compliance-grade software.

Milestone 2 — \$7,500

MILESTONE 2 — FULL SCOPE

\$7,500

One number covering: new coin types & pricing methods, graded coin lookup (PCGS + CDN), eBay comps via Apify, full deal flow (intake → photos → signature → offer letter → SMS), GHL bidirectional webhook, complete compliance engine, expanded Deal_Log table, and Loom walkthrough.

What the M2 quote covers

New coin types & pricing methods

- Eight bullion coins priced at $\text{unit} \times \text{spot} + \text{per-coin configurable premium}$ (American Silver Eagle, four Gold Eagle sizes, Canadian Maple Leaf, Krugerrand, Mexican Onza)
- Sterling silver flatware: $\text{gram weight} \times \text{purity} \times \text{spot}$, with mandatory hallmark popup that the rep must dismiss before entering weight
- Four foreign silver coin entries with stored purity factors, fourth entry has a manual purity override selector
- Paper money: manual entry with denomination, year, condition selector, offer amount, and the static manager-review note
- Numismatic grading selector (Circulated / Uncirculated / Slabbed) with per-condition multipliers from Airtable
- Pre-1933 US Gold full-screen red hard stop (Double Eagle, Eagle, Half Eagle, Quarter Eagle) with timestamped acknowledgment written to the deal record

Graded coin lookup

- Browser-based barcode scanner for Code 128 and QR codes, with manual cert entry as fallback
- PCGS CoinFacts API integration for cert authentication and coin identity
- CDN Greysheet Dealer+ API integration for wholesale pricing at grade
- Fallback chain: CDN → Manual_Price_Override table → "contact manager" prompt
- Side-by-side display of CDN price and calculated offer at margin

eBay comps for collectibles

- Make.com integration with the Apify eBay Sold Listings actor
- Low / median / high range display
- Range logged to deal record on every lookup

Full deal flow

- Customer intake screen with all six required fields, under-18 hard stop, TCPA opt-in capture
- Driver's license capture (see decision item below regarding camera capture vs. photo + manual entry)
- Mandatory collection photo upload to Airtable as attachment
- Item entry screen with dual real-time totals (100% melt, offer at margin) always visible
- Deal summary screen with per-line breakdown, totals, margin percentage, Accept / Decline
- One-tap customer-facing flip view that hides the margin percentage
- **Acceptance flow:** payment method selector, \$9,500 cash hard stop with manager PIN override, auto-generated offer letter PDF, on-screen customer signature capture, mandatory item photos, Google review prompt with QR code, automatic SMS of the deal summary PDF link to opted-in customers via the GHL webhook
- **Decline flow:** 24-hour price lock button, deal_declined record in Airtable with price-lock flag, declined webhook fired to GHL with the appropriate tags

GHL bidirectional integration

- Accepted-deal webhook with the full payload spec (customer info, deal value, item tags, deal ID)
- Declined-deal webhook with contact info and tag set
- Make.com captures GHL's response and writes GHL_Contact_ID and GHL_Opportunity_ID back to the matching Airtable deal record

Compliance automation

- **Texas 48-hour law enforcement report** — nightly Make scenario at 11 PM, formatted email to the address in Config_Operator, all required fields per spec
- **Structuring detection** — same-customer or same-DL cash-transaction lookback over a 24-hour rolling window, manager alert with prior history before either deal can close, both deals flagged
- **Form 8300 flag** — automatic write to Form_8300_Flag when single cash transaction exceeds \$10,000 after manager override
- **1099-B threshold tracking** — rolling 12-month per-customer (by DL) volume tracking with SSN/EIN capture prompt at threshold, both flag fields written

Deal_Log table expansion

- All 35+ fields built per spec, with exact column names
- Operator_ID and Location_ID auto-populated on every deal from the single-row config tables
- Spot price snapshot for both gold and silver captured at the exact moment of deal completion

Loom walkthrough

- Recorded admin walkthrough covering every editable Make scenario setting and every Airtable config table — written so a non-technical admin or a future developer can update margins, add coin types, change locations, or modify compliance recipients without breaking anything

Milestone 3 — \$3,500 (protection layer only)

MILESTONE 3 — PROTECTION LAYER

\$3,500 + \$350 PWA already contracted

The PWA frontend stays at the previously agreed \$350. This quote covers only the new protection and usability layer added on top of it.

What the M3 protection-layer quote covers

Authentication & permissions

- Rep PIN authentication (4-digit, encrypted in Reps_Master); three failed attempts locks the app for 5 minutes and notifies the manager

- Separate manager PIN tier with override authority over yellow flags, high-value approvals, full activity log access
- App auto-lock after 2 minutes of inactivity, requires Face ID or PIN to reopen

Three-color flag system

- Green / Yellow / Red flag logic on every deal
- Red triggers: deal exceeds high-value threshold, any Pre-1933 US Gold selected, cash approaches \$9,500, entered weight off expected by >10%, structuring pattern detected

Manager workflows

- **High-value approval gate:** rep blocked at "Pending Approval" screen until manager approves remotely; deal record updated to Pending_Approval until acted on
- **Ask Manager button:** permanent on every screen; freezes deal state, notifies manager with current line items + totals, writes timestamped note
- **Not Sure What This Is button:** three options — photo to manager, search reference guide, save to pending deals
- **Suspicious Item workflow:** rep flag pauses the deal, manager PIN required to continue, full audit trail written

Estate Lot Bulk Estimate Mode

- Sample-and-extrapolate workflow with visible "this is an estimate" disclaimer

Picker usability enhancements

- Coin image and expected gram weight in the picker
- Search and filter bar at the top of the picker
- "Recently used" quick-tap row with last 6 coin types
- Key date warnings embedded in the picker, pulled from key_date_warning
- Spot price 24-hour change indicator on the main screen
- Plain-English tooltips on Face Value, Melt Value, and Times Face

Critical risks and dependencies

The items below are not me asking for outs — they are the parts of the build where outcome depends on something outside my control or where the spec needs a decision before I can lock the architecture. Flagging them now prevents surprises later.

RISK 1 — API ACCESS (M2 BLOCKER)

PCGS CoinFacts and CDN Greysheet API access must be confirmed live before M2 starts

Both APIs are gated. PCGS CoinFacts is selectively granted; CDN Greysheet Dealer+ requires a paid subscription with the API tier enabled. The scope document already requires confirmation of all four API keys (PCGS, CDN, GoldAPI, Apify) before M2 begins — I will not start M2 until all four are confirmed returning data in Make.com. If either PCGS or CDN cannot be obtained, the graded coin lookup feature must be rescoped down to manual cert entry plus the Manual_Price_Override fallback table only.

RISK 2 — DRIVER'S LICENSE CAMERA CAPTURE

Automated DL OCR in a PWA requires a paid third-party SDK

Standard browser camera APIs cannot reliably parse the PDF417 barcode on US driver's licenses, especially on iOS Safari. True automated DL capture (where the rep scans and the DL number is parsed automatically) requires a commercial SDK — Microblink BlinkID, Scandit, or Mitek typically run \$200–\$2,000/month in license fees. Without one, "camera capture" reduces to: rep takes a photo of the DL (uploaded to Airtable as the audit record) and types the DL number into a manual field. That fallback is functional and complies with the spec's "or manual entry of DL number" wording, but it is not a hands-free scan. **Decision needed before M2 starts.**

RISK 3 — SSN / EIN ENCRYPTION (1099-B)

Airtable is not architected for compliance-grade encrypted PII storage

Airtable provides encryption at rest as part of their platform, but it does not offer field-level customer-managed encryption. If the operator's compliance posture requires audit-grade encryption of SSNs and EINs (typical for IRS-reportable data), Airtable is the wrong store for that field. The options are: (a) accept Airtable's platform-level encryption-at-rest as the documented security boundary, (b) encrypt SSN/EIN client-side before writing to Airtable with a dev-managed key, or (c) route SSN/EIN to a separate vault (HashiCorp Vault, AWS Secrets Manager, or a managed service like Stripe Identity). Options (b) and (c) add scope not included in this quote. **Client decision required.**

RISK 4 — REAL-TIME MANAGER APPROVAL GATE

iOS PWA push notifications are less reliable than native push

iOS Safari Web Push only works for installed PWAs (iOS 16.4+) and Apple throttles delivery aggressively. A high-value approval gate that depends on push for sub-second manager response will see occasional delays. The reliable architecture is short-interval polling: the rep's "Pending Approval" screen checks Airtable every 5–10 seconds for status change, and the manager acts from a manager-side screen in the PWA. This will be the default approach unless we discover a reason to layer push on top.

RISK 5 — TEXAS 48-HOUR LE REPORT FORMAT

Spec lists the required fields but not the required format

The recipient (local PD or Texas DPS) typically dictates the format — it might be a PDF email, a structured CSV, or an upload to a state portal. Each is a meaningfully different build. Default assumption is a formatted PDF email per the scope wording ("emails a formatted transaction report"). If the recipient requires a different format, that is a small adjustment, but it needs confirmation before final delivery.

RISK 6 — APIFY EBAY SCRAPER RELIABILITY

Third-party eBay data is subject to upstream rate-limiting and anti-scraping

The Apify eBay Sold Listings actor scrapes a website that actively defends against scraping. Most lookups will return data; some will return empty or partial results, especially under load. The build will treat "no comps returned" as a valid outcome and the rep falls back to judgment. The 50-runs/day plan minimum should be sufficient for normal floor traffic.

Decisions needed before M2 starts

DECISION 1

Driver's license capture: SDK or photo + manual entry?

If automated OCR is required, please confirm budget for a paid SDK license (\$200–\$2,000/month recurring). If photo + manual DL number entry is acceptable, no extra cost — that is the default.

DECISION 2

SSN / EIN storage: Airtable encryption-at-rest or separate vault?

Confirm that Airtable's platform-level encryption-at-rest is the accepted security boundary for the SSN_EIN_Captured field, or scope the work for a separate encrypted vault as an addition.

DECISION 3

Texas 48-hour report format

Confirm whether a formatted PDF email is acceptable, or specify the required format / recipient system.

DECISION 4

API credentials confirmed live in Make.com

Per the scope document, M2 does not start until PCGS CoinFacts, CDN Greysheet Dealer+, GoldAPI, and Apify (paid plan, 50 runs/day minimum) are all confirmed returning data in Make.com under the operator's credentials.

Honest timeline

The scope document targets a fully deployed app within 90 days. That target is **tight but achievable for M2 alone**, assuming all four API credentials are live in week 1 and the four decisions above are answered in week 1.

For both M2 and M3 combined, the realistic range is:

Phase	Realistic duration	Notes
M2 — Full scope	60–90 days	From confirmed API access. Compliance automation and the deal flow are the largest blocks.
M3 — Protection layer	30–45 days	Largely additive on top of the M2 deal flow. Some overlap with M2 testing is possible.
Combined M2 + M3	90–120 days	90 days is achievable only with zero blockers on APIs and the four decisions resolved week 1.

Payment structure

Recommended payment milestones for both new quotes:

- **M2 (\$7,500):** 40% on kickoff once APIs and decisions are confirmed (\$3,000), 30% at the deal flow + compliance engine demo (\$2,250), 30% on iPad acceptance test pass (\$2,250).
- **M3 protection layer (\$3,500):** 50% on kickoff after M2 sign-off (\$1,750), 50% on iPad acceptance test pass (\$1,750).

What is *not* in this quote

To set expectations clearly:

- **Inside-GHL automations** — the scope explicitly limits the GHL work to the outbound webhook on the Make.com side. Anything that happens inside GHL after the webhook fires (workflow logic, SMS

templates, follow-up sequences, opportunity pipeline configuration) is handled separately and is not in scope.

- **Recurring third-party API and infrastructure costs** — PCGS, CDN Greysheet, GoldAPI, Apify, Make.com Pro tier, Vercel, Airtable, optional DL OCR SDK, optional SSN vault. These are operator costs, not dev costs.
- **Hardware** — iPads, mounts, barcode scanners (if external) are not included.
- **Branding assets** — logo, accent color, app name. Build proceeds with placeholders; final assets land via follow-up update.
- **Post-launch new features** — the M3 PWA contract includes 3 months of bug-fix support. New features after launch are separate scope.
