
PROJECT UPDATE — MAY 2026

M1 Fixes Handover

The three fixes you flagged are live. Here's what changed and what to verify.

Prepared for	Keyshaun
Project	Coin Appraisal Register — M1
Date	6 May 2026
Built by	Flowtive (kristof@getflowtive.com)
Live URL	https://coin-appraisal-register.vercel.app

Summary

All three M1 fixes from your May 5th note are now deployed and running on the live URL. The remaining items below are **configuration choices that belong with you** — populating the new numismatic coin values in Airtable, and confirming the margin percentages — neither requires any further development work from me.

Please run through the verification walkthrough on the next page on a laptop or iPad. It takes about 5 minutes and demonstrates each of the three fixes plus how the new error handling looks.

What was addressed

Fix 1 — Numismatic / "times-face" pricing path

Coins like Wheat Pennies, Buffalo Nickels, Indian Head Pennies, and Costume Jewelry don't price by metal weight — they price as a multiple of face value. The app now supports this end-to-end:

- Eleven new coin types added to the Add Coin picker, grouped under a new **"Numismatic / Other"** section at the bottom of the list.
- The Airtable `Config_CoinTypes` table has a new `fixed_multiplier` column. The offer for each line is computed as **quantity × face value × fixed_multiplier**.
- These items contribute to the **Offer at Margin** total but not to the **100% Melt** total — by design, since they have no metal value.

Fix 2 — Numeric keypad on iPad quantity inputs

Every quantity and weight field on the iPad now opens a number-only keypad. The full alphanumeric keyboard never appears for these inputs. Weight fields (grams) include a decimal point; count fields (coins) are whole numbers only. This applies in both the Add Coin modal and when editing a quantity directly in the bag.

Fix 3 — Real-time dual totals (without tapping Calculate)

The header now shows **two totals** that update on every Add or quantity change — without requiring a Calculate Total tap:

- **100% Melt** — what the metal in the bag is worth at current spot prices.
- **Offer at Margin** — what your policy says you'll pay for it.

Calculate Total still exists and still runs the authoritative server-side calculation — its result is shown as a green "Last calculated total" badge. The two header values give the rep an instant sense of where the deal sits as items are being added.

Verification walkthrough

Run this on the live URL — laptop browser or iPad both work. About 5 minutes.

LIVE APP URL

<https://coin-appraisal-register.vercel.app>

1 Open the app and tap Refresh Config

This pulls the latest config from Airtable, including spot prices and margins.

Expect: Spot prices banner appears at the bottom showing gold, silver, and platinum rates.

2 Pick a rep and add a Roosevelt Dime, qty 10

Open Add Coin → Silver section → tap Roosevelt Dime → enter **10** → Add to Bag.

Expect: Both the **100% Melt** and **Offer at Margin** totals at the top of the screen populate immediately — without tapping Calculate Total. (This is Fix 3 working.)

3 Add 14K Gold, weight 5 grams

Open Add Coin → Gold section → tap 14K Gold → enter **5** → Add to Bag. Confirm the keypad shows a decimal point.

Expect: Both totals update again, on the Add. The decimal keypad appears for grams. (This is Fix 2 + Fix 3.)

4 Add a Wheat/Steel Penny, qty 100

Open Add Coin → scroll to **Numismatic / Other** at the bottom → tap Wheat/Steel Penny → enter **100** → Add to Bag.

Expect: The Offer at Margin goes up by an amount equal to $100 \times \text{face_value} \times \text{fixed_multiplier}$ (whatever values you've populated for that row in Airtable). The 100% Melt does *not* change — numismatic items don't have a melt value. (This is Fix 1 working.)

5 Tap Calculate Total

The green button at the bottom of the screen.

Expect: A green "Last calculated total" badge appears with the authoritative server-computed total. It should match the live **Offer at Margin** value within a cent or two of rounding.

6 Add an Indian Head Penny, qty 5

This row exists in Airtable but its `face_value` and `fixed_multiplier` are not yet populated (see the next section). This step demonstrates how the app handles that gracefully.

Expect: The Indian Head Penny row in the bag is highlighted with a **red background and a red left border**, with the label **"Missing pricing data"** underneath the quantity. Above the bag, a prominent **red banner** reads "Some lines are missing pricing data — Calculate for full result." The line does not contribute to either total until it's populated.

7

Remove the Indian Head Penny row

Tap the × on that row.

Expect: The red row disappears, the red banner disappears, both totals recalculate automatically.

What still needs your input

None of the items below require further development from me. They are configuration choices that live in your Airtable base.

1. Populate the 10 numismatic coin values in Airtable

Action: open the `Config_CoinTypes` table in Airtable. Ten of the eleven new numismatic rows have `face_value` and `fixed_multiplier` blank. Fill those in per your pricing. Until you do, those coins will appear in the picker but will trigger the "Missing pricing data" red banner if a rep adds them.

The eleven rows added during the fix:

Coin	Face value	Fixed multiplier
Wheat / Steel Penny	populated	populated
Indian Head Penny	blank	blank
Flying Eagle Penny	blank	blank
Large Cent	blank	blank
Half Cent	blank	blank
2 Cent Piece	blank	blank
3 Cent Piece	blank	blank
Shield Nickel	blank	blank
Victory Nickel	blank	blank
Buffalo Nickel	blank	blank
Costume Jewelry	blank	blank

For each row, the offer paid per item is `face_value × fixed_multiplier`. For example, a Wheat Penny at `face_value = 0.01` and `fixed_multiplier = 5` pays \$0.05 per coin. You set both numbers — there is no default.

2. Confirm the margin percentages in `Config_Margins`

Action: open the `Config_Margins` table in Airtable. All four rows currently read `margin_pct = 0.9`, which means the app pays **90% of melt** for silver, gold, platinum, and collectibles. The original seed value was `0.30` (i.e., 30% of melt). Please confirm whether 0.9 is intentional before staff use this on the floor for a real customer.

The math is the same on both sides: `offer = melt × margin_pct`. So:

- `0.30` → on \$100 of silver melt, the offer is \$30.
- `0.90` → on \$100 of silver melt, the offer is \$90.

The change is yours to make in Airtable — no code change, no developer in the loop. The next Calculate Total on any iPad will use whatever values are saved when you save the row.

3. iPad install + on-device smoke test

Once an iPad is in hand, run the seven-step walkthrough above on the device itself. The most important thing to confirm on iOS specifically — which I cannot test from a laptop browser — is that **every quantity field opens the numeric keypad**, not the full alphanumeric keyboard. If at any point the full keyboard appears for a quantity input, please flag it.

Install steps for adding the app to the iPad home screen are in the original M1 handover document.
